

An improved approach for semantic graph composition with CCG

AUSTIN BLODGETT & NATHAN SCHNEIDER

GEORGETOWN UNIVERSITY

AMR has no Syntax-Semantics Interface

AMR + CCG

Syntax

CCG

Semantics
(Abstract Meaning Representation)

Why CCG

Combinatory Categorical Grammar

- Broad-coverage parsing
- Transparent Syntax-Semantics Interface

Our Contributions

Goal: Design interpretable, linguistically meaningful AMR derivation

Contribution:

We directly represent the semantics of CCG entries as AMR subgraphs with free variables

Definitions of combinators (including new definitions of symmetric and type-raising combinators) allow for compositional derivations

Related Work

- **AMR-English Syntax alignment:** Alignment is an important precedent for compositional AMR (*Chen and Palmer, 2017; Szubert et al., 2018*)
- **AMR Parsing SOTA:** No supervision for alignment (*Lyu and Titov, 2018; Zhang et al., 2019*)
- **AMR and CCG:**
 - Induced lambda calculus semantics (*Artzi et al., 2015*)
 - Graph algebraic formalization with HR algebra (*Beschke and Menzel 2018*)
- **Other Graph Semantic Representations with CCG** (*Baldrige and Kruijff, 2002*)

Outline from Here

1. AMR: The Basics
2. CCG: The Basics
3. A Simple Example
4. Our Approach
5. Novel Combinators
6. Unsolved Problems
7. Contributions & Next Steps

AMR: The Basics

Abstract Meaning Representation

Reference sentence: "I promised to bring back souvenirs"
(or: "my promise that I will bring souvenirs back")

DAG (Directed Acyclic Graph) data structure to capture the meaning of a sentence.

Abstracts away from syntax and morphology.

Computation friendly:
Semantically related elements are close together

AMR: The Basics

Abstract Meaning Representation

neo-Davidsonian predicate calculus

$$\exists x, y, e_1, e_2 \left[\text{PROMISE}(e_1) \wedge \text{AGENT}(e_1)(\text{SPEAKER}) \wedge \text{THEME}(e_1)(e_2) \wedge \right. \\ \left. \text{BRING}(e_2) \wedge \text{AGENT}(e_2)(\text{SPEAKER}) \wedge \text{THEME}(e_2)(x) \wedge \right. \\ \left. \text{SOUVENIR}(x) \wedge \text{DIRECTION}(e_2)(y) \wedge \text{BACK}(y) \right]$$

Reference sentence: "I promised to bring back souvenirs"

AMR: The Basics

Abstract Meaning Representation

neo-Davidsonian predicate calculus

$\text{PROMISE}(e_1) \wedge \text{BRING}(e_2) \wedge \text{SOUVENIR}(x) \wedge \text{BACK}(y)$
SPEAKER

Reference sentence: "I promised to bring back souvenirs"

AMR: The Basics

Abstract Meaning Representation

Reference sentence: "I promised to bring back souvenirs"

neo-Davidsonian predicate calculus

$$\begin{aligned} & \text{AGENT}(e_1)(\textit{speaker}) \wedge \text{THEME}(e_1)(e_2) \wedge \\ & \text{AGENT}(e_2)(\textit{speaker}) \wedge \text{THEME}(e_2)(x) \wedge \\ & \text{DIRECTION}(e_2)(y) \end{aligned}$$

AMR: The Basics

Abstract Meaning Representation

neo-Davidsonian predicate calculus

$\exists x, y, e_1, e_2$

AMR Ignores:

Existential quantification of variables,
Definiteness, number, tense

Reference sentence: "I promised to bring back souvenirs"

AMR: What's Missing

Abstract Meaning Representation

What's Missing?

AMR is not a compositional semantics

Not clear how to derive an AMR graph given sequence of words

AMR derivation does not correspond to any linguistic process

AMR: What's Missing

Abstract Meaning Representation

What We Want?

Better structure for introducing inductive biases into AMR parsing.

AMR derivation that is similar to something linguistically meaningful, i.e. composition.

CCG: The Basics

bring	back	souvenirs
$(S \backslash NP) / NP$	$(S \backslash NP) \backslash (S \backslash NP)$	NP

CCG: The Basics

bring	back	souvenirs
<hr/>	<hr/>	<hr/>
$(S \backslash NP) / NP$	$(S \backslash NP) \backslash (S \backslash NP)$	NP
<hr/>		$<B$
$(S \backslash NP) / NP$		

CCG: The Basics

CCG: The Basics

bring	back	souvenirs
$(S \backslash NP) / NP$	$(S \backslash NP) \backslash (S \backslash NP)$	NP

bring-01 :ARG0 2 :ARG1 souvenir :direction back

Decomposing AMR

Next Step

Convert combinators from operating on lambda term semantics to operating on AMR subgraphs.

Next Step

Convert combinators from operating on lambda term semantics to operating on AMR subgraphs.

Combinators: Function Application, Composition, Type Raising, Relation-wise Application, Relation-wise Composition.

Next Step

Convert combinators from operating on lambda term semantics to operating on AMR subgraphs.

Combinators: Function Application, Composition, Type Raising, Relation-wise Application, Relation-wise Composition.

Philosophy in CCG: Isomorphism between syntax and semantics

- Every syntactic argument should correspond to a semantic argument

bring
—
 $(S \backslash NP) / NP$
bring-01 :ARG0 2 :ARG1 1

souvenirs
—
NP
souvenir

Next Step

Convert combinators from operating on lambda term semantics to operating on AMR subgraphs.

Combinators: Function Application, Composition, Type Raising, Relation-wise Application, Relation-wise Composition.

Philosophy in CCG: Isomorphism between syntax and semantics

- Every syntactic argument should correspond to a semantic argument
- Our approach: $\# \text{ free variables} \leq \# \text{ syntactic arguments}$
- **Why not =?**

bring	back	souvenirs
$(S \backslash NP) / NP$	$(S \backslash NP) \backslash (S \backslash NP)$	NP
bring-01 :ARG0 [2] :ARG1 [1]	[1] :direction back	souvenir

Combinators: Standard CCG

Conjunction

Application

Composition

Type-Raising

Combinators: This Work

Relation-wise Application/Composition

Function Application (< or >)

example

bring

souvenirs

(S\NP)/NP

NP

bring-01 :ARG0 [2] :ARG1 [1]

souvenir

Procedure: Substitute a *free variable* with the argument's root

Function Application (< or >)

example

bring	souvenirs
_____	_____
(S\NP)/NP	NP
bring-01 :ARG0 [2] :ARG1 [1]	souvenir
_____>	
S\NP	
bring-01 :ARG0 [2] :ARG1 souvenir	

Procedure: Substitute a *free variable* with the argument's root

Function Application (< or >)

example

bring	souvenirs
<hr/>	<hr/>
(S\NP)/NP	NP
bring-01 :ARG0 [2] :ARG1 [1]	souvenir
<hr/>	
S\NP	
bring-01 :ARG0 [2] :ARG1 souvenir	

general form

A/B	B
...1 [1] ...2	a ...3
<hr/>	
A	
...1 a ...3 ...2	

Procedure: Substitute a *free variable* with the argument's root

Composition (<B or >B)

example

bring

$(S \backslash NP) / NP$

bring-01 :ARG0 [2] :ARG1 [1]

back

$(S \backslash NP) \backslash (S \backslash NP)$

[1] :direction back

general form

Procedure: Same as function application, but reorder FV list

Composition (<B or >B)

example

bring	back
$(S \backslash NP) / NP$	$(S \backslash NP) \backslash (S \backslash NP)$
bring-01 :ARG0 [2] :ARG1 [1]	[1] :direction back
<hr/>	
$(S \backslash NP) / NP$	
bring-01 :ARG0 [2] :ARG1 [1]	
:direction back	

<B

general form

Procedure: Same as function application, but reorder FV list

Composition (<B or >B)

example

bring	back
$(S \backslash NP) / NP$	$(S \backslash NP) \backslash (S \backslash NP)$
bring-01 :ARG0 [2] :ARG1 [1]	[1] :direction back
$\xrightarrow{\quad} <B$	
$(S \backslash NP) / NP$	
bring-01 :ARG0 [2] :ARG1 [1]	
:direction back	

general form

A/B	B/C
$\dots_1 [1] \dots_2$	$a \dots_3$
$\xrightarrow{\quad} >$	
A/C	
$\dots_1 a \dots_3 \dots_2$	

Procedure: Same as function application, but reorder FV list

Composition (<B or >B)

example

bring	back
$(S \backslash NP) / NP$	$(S \backslash NP) \backslash (S \backslash NP)$
bring-01 :ARG0 [2] :ARG1 [1]	[1] :direction back
$\xrightarrow{\quad} <B$	
$(S \backslash NP) / NP$	
bring-01 :ARG0 [2] :ARG1 [1]	
:direction back	

general form

$$\begin{array}{c}
 A/B \quad B/C \\
 \dots_1 \boxed{1} \dots_2 \quad a \dots_3 \\
 \hline
 A/C \\
 \dots_1 a \dots_3 \dots_2
 \end{array}
 \xrightarrow{\quad}$$

* Order of free variables matters

Procedure: Same as function application, but reorder FV list

Classic Problems for Graph Semantics

Subject Control, e.g.
“I promised John to buy a
ticket”

Classic Problems for Graph Semantics

Object Control, e.g.
“I asked John to buy a ticket”

Classic Problems for Graph Semantics

Raising, e.g.
“John seems to be slacking”

Classic Problems for Graph Semantics

Raising, e.g.
"John seems to be slacking"

$$seem := \lambda P, x [\text{SEEM}(P) \wedge P(x)]$$
$$seem := \lambda e, x [\text{SEEM}(e) \wedge \text{AGENT}(x)]$$

Relation-wise Application (<R or >R), Relation-wise Composition (<RB or >RB)

example

promised

$S \backslash NP / (S_{to} \backslash NP)$

promise-01 :ARG0 [2]
:ARG2 ([1] :ARG0 [2])

to bring

$(S_{to} \backslash NP) / NP$

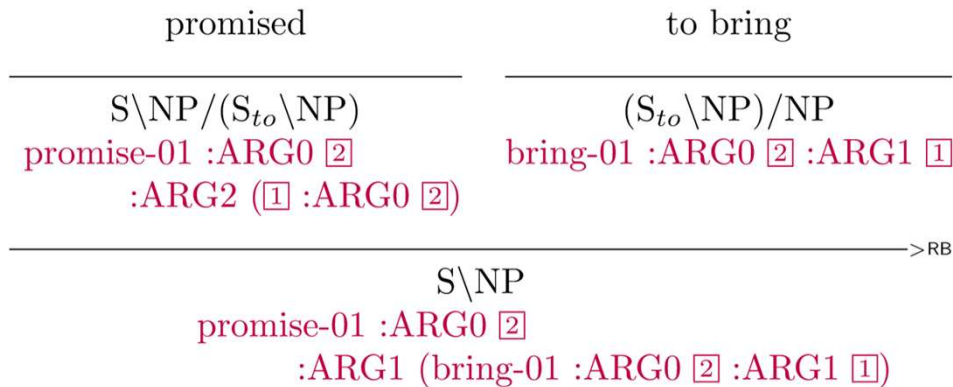

bring-01 :ARG0 [2] :ARG1 [1]

general form

Procedure: Substitute a *relation* instead of a node

Relation-wise Application (<R or >R), Relation-wise Composition (<RB or >RB)

example

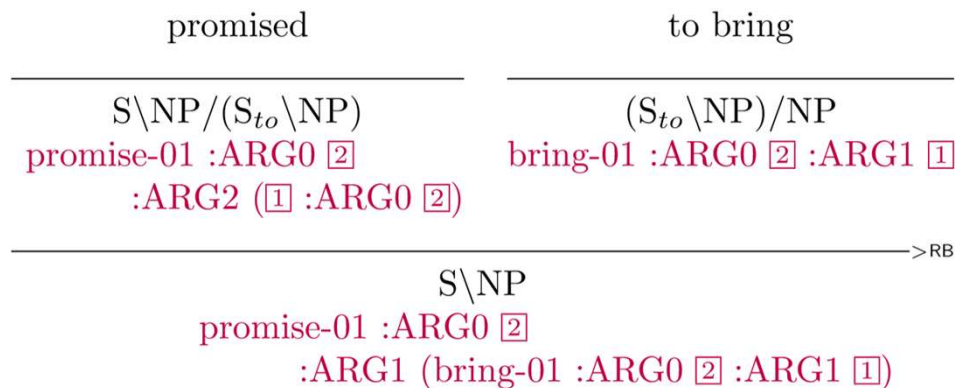

general form

Procedure: Substitute a *relation* instead of a node

Relation-wise Application (<R or >R), Relation-wise Composition (<RB or >RB)

example

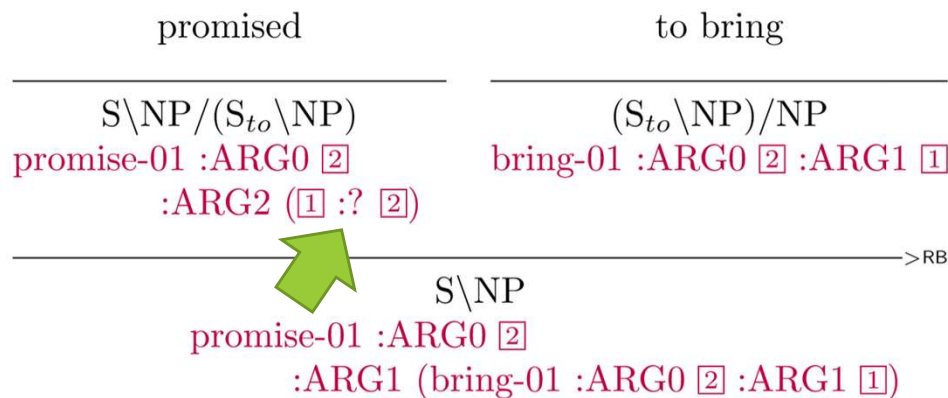

general form

Procedure: Substitute a *relation* instead of a node

Relation-wise Application (<R or >R), Relation-wise Composition (<RB or >RB)

example

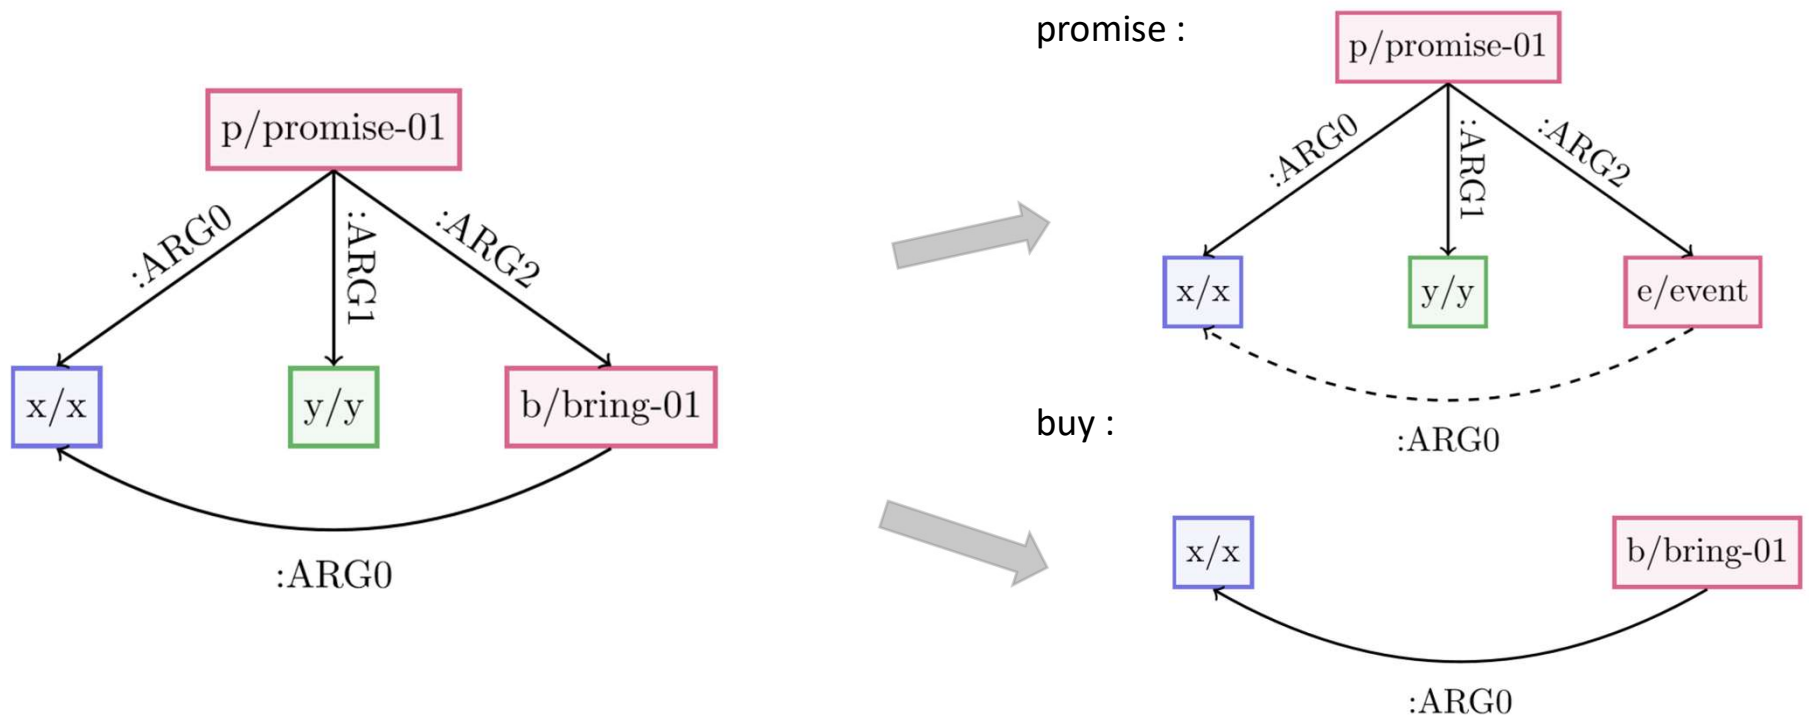

general form

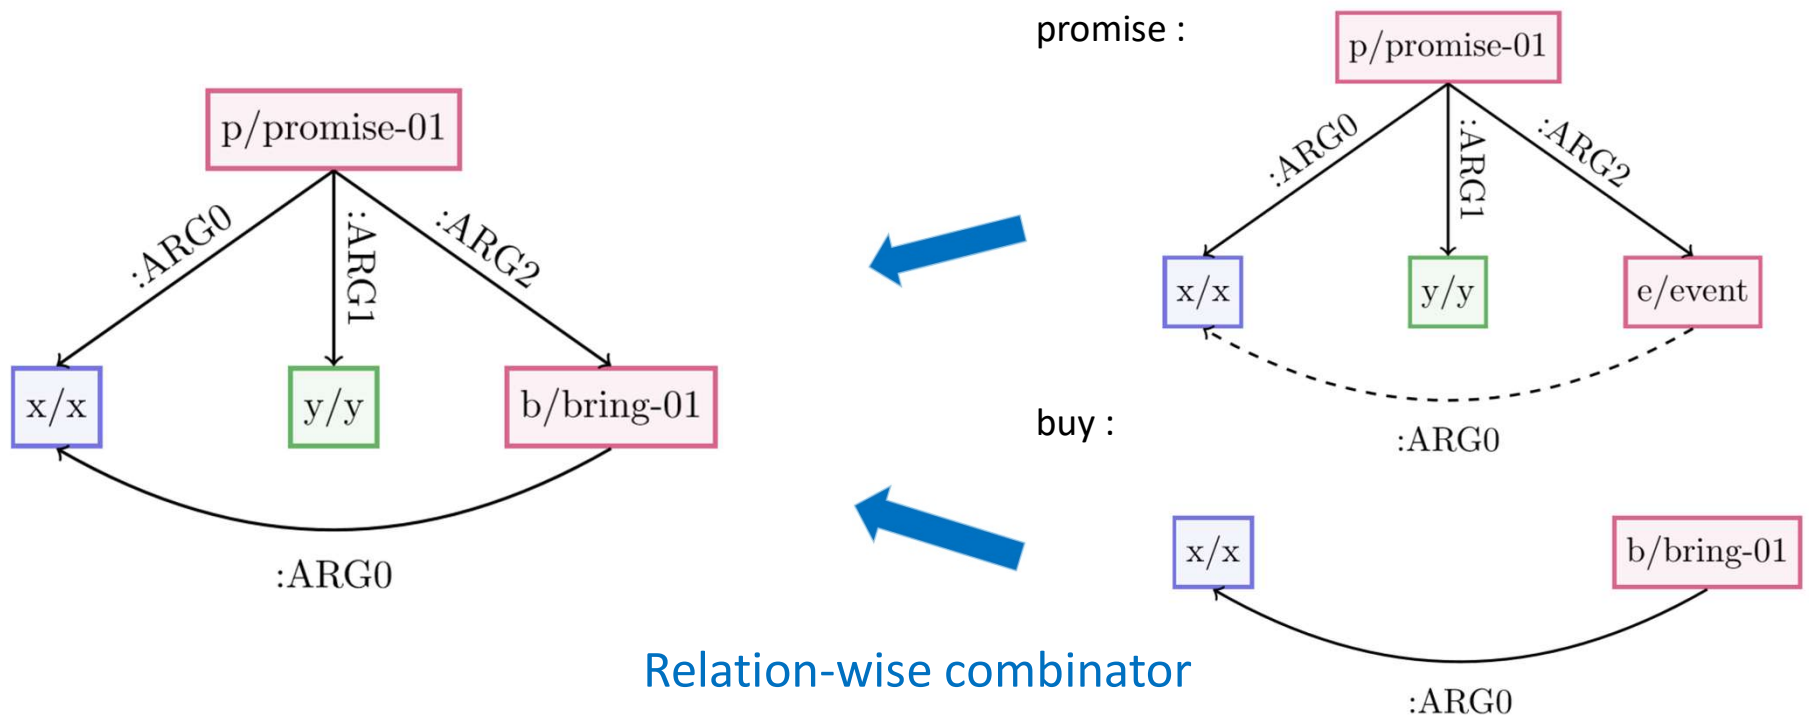

Procedure: Alternatively, use an underspecified edge :?

Decomposing AMR

Relation-wise derivation

Uses of Relation-wise Composition

We use relation-wise combinators for:

- *Control*
- *Raising*
- *Wh-questions*
- *Relative clauses*
- *Type raising*
- *Eventive Nouns*

Type Raising (<T or >T)

example

You

NP

you

general form

Procedure: Construct a new root which is a free variable

Type Raising (<T or >T)

example

You

—

NP

you

— $>T[S]$

$S/(S \backslash NP)$

$\boxed{1} :? \text{you}$

For example in
complex coordination

general form

Procedure: Construct a new root which is a free variable

Type Raising (<T or >T)

example

You

—

NP

you

—^{>T[S]}

S/(S\NP)

[1] :? you

general form

A

a ...₁

—^{>T[B]}

B/(B\A)

[1] :? a ...₁

Procedure: Construct a new root which is a free variable

Type Raising (<T or >T)

example

You

—

NP

you

— $>T[S]$

$S/(S \backslash NP)$

$\boxed{1} :? \text{you}$

general form

A

$a \dots 1$

— $>T[B]$

$B/(B \backslash A)$

$\boxed{1} :? a \dots 1$

fill edge with relation-wise
combinator

Procedure: Construct a new root which is a free variable

Unsolved: Modifying Modals

Tomorrow	John may eat rice

Appendix: Relation-wise case 1 vs. 2

1) Same edge on both sides

Constrains which constituents can
combine (heuristically or with statistics).
Possibly better at dealing with noise.

2) Underspecified (or free variable) edge

More general.
Captures the fact that syntactic information
is only *correlated* with semantic roles.

Appendix: Type Raising (more detail)
